

Foundation Model Registration — AI Bill of Materials (AIBOM)

Meridian National Bank — Model & Use-Case Inventory Shared Component Record · Inventory ID: FM-0007 · Status: Registered / Approved for use Owner (second line): Model Risk Management · Last reviewed: current cycle

This record governs the **shared foundation model** underlying multiple use cases. Individual use cases (see UC-records) are registered and tiered separately. This AIBOM is shared evidence for the third-party foundation-model risk* control across all use cases built on this model.

1. Model Identity

Field	Value
Foundation model	Anthropic Claude (Opus / Sonnet family)
Access path	Amazon Bedrock (Bank AWS tenant, in-VPC endpoint)
Provider	Anthropic, via AWS Bedrock managed service
Model class	Large language model (generative, non-deterministic)
Version pinning	Pinned to a named model version; provider updates tracked via change management
Model card / system card	Anthropic system card on file (see corpus: anthropic-system-card.pdf)

2. Provenance and Data Handling

- Training data: per Anthropic system card; Bank has reviewed the card's description of data sources and evaluation methodology.
- **No-training confirmation:** Under the AWS Bedrock service terms, Bank inputs and outputs are **not** used to train the provider's base models and are not shared with the model provider. Confirmed for standard Bedrock invocation.
- Data residency: inference occurs within the Bank's AWS region and VPC; prompts and completions do not leave the Bank perimeter.
- Nth-party / value chain: Anthropic (model) → AWS (hosting). No further downstream sharing.

3. Security Posture

- Access via IAM-scoped service roles; per-use-case credentials.
- Prompt/response logging to Bank-controlled storage for monitoring and audit.

- Provider safety features (content filtering, refusal behavior) documented in the system card.

4. Update Cadence and Contingency

- Provider model updates are tracked; a version change is a change-management trigger requiring re-assessment of dependent use cases (Section 8 of MRM-014).
- Contingency: if the pinned version is deprecated, dependent use cases must re-validate against the successor version before continued production use.

5. Governance Notes

This AIBOM satisfies the **shared** portion of the third-party foundation-model risk control. **Use-case-level** adequacy (e.g., whether a given use case sends PII through this path, and whether the no-training confirmation covers that data class) is assessed per use case in its own record — the shared model being approved does not by itself clear a use case that introduces new data-sensitivity or autonomy risk.
