

Ongoing Monitoring Plan — UC-2041

Commercial Banking Policy Knowledge Assistant · First line monitoring; second-line challenge

Key Risk Indicators

KRI	Metric	Threshold	Cadence
Groundedness	Sampled groundedness score (RAG triad)	≥ internal threshold	Weekly
Unsupported-answer rate	% queries returning "no supported answer"	Monitored for drift	Weekly
Hallucination spot-check	Sampled answers vs. source passages	Zero material discrepancies	Weekly
Corpus freshness	Superseded documents removed	100%	On policy update
Usage scope	Prompts flagged for out-of-scope (customer data) content	Alert on any	Continuous

Alerting and Review

- Out-of-scope prompt attempts alert the platform team and MRM.
- Monitoring summary reviewed by MRM on the attestation cycle.

Re-Tiering Trigger

If the corpus or prompt scope is expanded to include customer/applicant data, or the use case is repurposed toward any customer-facing or decisioning function, the use case is **immediately re-tiered** (expected Tier 1) and full validation is required before continued use.

Drift

Given the constrained, allow-listed corpus and advisory-only design, drift risk is low. Provider model version changes are handled via change management (AIBOM FM-0007) and trigger a groundedness re-check.
