

RAG Grounding & Output Controls — UC-2041

Commercial Banking Policy Knowledge Assistant · First line: Enterprise AI Platform team

Source Allow-List

Retrieval is restricted to an **approved source allow-list**: the current, version-controlled set of commercial credit policy and procedure manuals. Documents are ingested from the Bank's controlled document repository; superseded versions are removed. No open-web or ungoverned sources are retrievable.

Grounding and Citation

- Every answer must cite the specific policy document and section it is grounded in; answers without a retrievable source are suppressed with a "no supported answer" response.
- Groundedness is measured on a sampled basis using a context-relevance / groundedness check (RAG triad). Current sampled groundedness exceeds the internal threshold.

Hallucination Controls

- Because answers are constrained to cited passages from the allow-listed corpus and unsupported answers are suppressed, confabulation surface is limited by design.
- A weekly spot-check reviews a sample of answers against source passages; discrepancies are logged and fed back to prompt/retrieval tuning. No material hallucinations identified in the current review period.

Prompt-Injection Posture

- Basic input filtering and instruction-isolation are applied. Users are internal and authenticated, and the corpus is trusted (no untrusted external content is retrieved), which materially lowers indirect-injection exposure.
- A formal adversarial red-team battery has **not** yet been run; a one-time review of common injection patterns was performed at launch. *(Noted as a partial control.)*
